## Theorem (Classical)

Let  $\alpha \in \mathbb{R}$  and let  $\varepsilon > 0$ . Then there exist integers  $p$  and  $q$  with  $q > 0$  so that

$$\left| \alpha - \frac{p}{q} \right| < \varepsilon.$$

## Pros and Cons

- Pro: this relates easy-to-understand numbers (rational numbers) hard-to-understand numbers (real numbers).
- Con: this theorem is *ineffective*. It gives no indication of how large  $p$  or  $q$  must be to attain the desired accuracy.

# A More Useful Approximation Result

## Theorem (Classical)

*Let  $\alpha \in \mathbb{R}$  and let  $\varepsilon > 0$ . Then there exist integers  $p$  and  $q$  with  $q > 0$  so that*

$$\left| \alpha - \frac{p}{q} \right| < \varepsilon.$$

## Definition

A pair  $(p, q) \in \mathbb{Z}^2$  is said to be *primitive* if  $\gcd(p, q) = 1$ .

## Connection to Rationals

We will regularly use the one-to-one correspondence

$$\begin{aligned} \{\text{primitive pairs } (p, q) \in \mathbb{Z} \times \mathbb{Z}_{>0}\} &\rightarrow \mathbb{Q} \\ (p, q) &\mapsto \frac{p}{q} \end{aligned}$$

## Definition

A complex number  $\alpha$  is said to be *algebraic* if there exists a polynomial  $f(x) \in \mathbb{Z}[x]$  with  $f(\alpha) = 0$ . Otherwise,  $\alpha$  is said to be *transcendental*.

Recall that irrational numbers fit into one of two categories.

## Definition

A complex number  $\alpha$  is said to be *algebraic* if there exists a polynomial  $f(x) \in \mathbb{Z}[x]$  with  $f(\alpha) = 0$ . Otherwise,  $\alpha$  is said to be *transcendental*.

## Question

Since we have approximation results which distinguish between rational numbers and irrational numbers, can we find an approximation result which distinguishes between algebraic and transcendental numbers?

## Question

Is there an approximation result that distinguishes between algebraic and transcendental numbers?

## Theorem (Roth, 1955)

*Suppose that  $\alpha \in \mathbb{R}$  is algebraic and  $\varepsilon > 0$ . Then there are only finitely many primitive pairs  $(p, q) \in \mathbb{Z}^2$  with  $q > 0$  so that*

$$\left| \alpha - \frac{p}{q} \right| < \frac{1}{q^{2+\varepsilon}}.$$

## Theorem (Thue, 1909)

*There are finitely many integer solutions to any Thue equation,  
 $F(x, y) = h$ .*

## Questions

- What are the solutions to  $F(x, y) = h$ ?
- How many (integer) solutions are there to  $F(x, y) = h$ ?
- On which features of  $F(x, y)$  and  $h$  do the number of solutions depend?

## Question

Why is the number of nonzero summands of  $F(x, y)$  relevant?

## Answer

- Recall that if  $F(p, q) = h$ , then  $\frac{p}{q}$  is close to a root of  $f(X) := F(X, 1)$ .

## Theorem (Mahler, 1934)

*Let*

$$V(F, 1) := \text{vol}\{(x, y) \in \mathbb{R}^2 : |F(x, y)| \leq 1\}.$$

*Then*

$$N(F, h) \asymp h^{2/n} V(F, 1)$$

## Theorem (Mahler, 1934)

Let

$$V(F, 1) := \text{vol}\{(x, y) \in \mathbb{R}^2 : |F(x, y)| \leq 1\}.$$

Then

$$N(F, h) \asymp h^{2/n} V(F, 1)$$

*i.e. there are constants  $C_1$  and  $C_2$  so that*

$$C_1 h^{2/n} V(F, 1) \leq N(F, h) \leq C_2 h^{2/n} V(F, 1).$$

## Moral

The factor of  $h^{2/n}$  is necessary and sufficient and we expect

$$N(F, h) \approx h^{2/n} \cdot N(F, 1).$$

# Exploring $N(F, 1)$

## Previous Facts

- Solutions  $(p, q)$  to  $|F(x, y)| \leq 1$  correspond to rational approximations of some root of  $f(X) := F(X, 1)$ .

and the inductive relation

$$q_{i+1} > \frac{q_i^{\frac{n}{s}-1}}{K}$$

hold.

**Lemma (K., 2021)**

*If  $n \geq 3s$  and there are  $t + 1$  medium solutions associated to  $\alpha$ , then*

$$t \leq \frac{\log \left[ \frac{\log Y_L K^{-1/(\frac{n}{s}-2)}}{\log Y_S K^{-1/(\frac{n}{s}-2)}} \right]}{\log \left( \frac{n}{s} - 1 \right)}.$$

*Moreover, this bound is as sharp as possible, given existing approximation results.*

## Theorem (K., 2021)

The number of primitive medium solutions to  $|F(x, y)| \leq h$  when  $n \geq 3s$  is

$$\ll s \left( 1 + \log \left( s + \frac{\log h}{\max(1, \log H)} \right) \right)$$

## Bounds for Small and Large Solutions

- The number of large primitive solutions is  $\ll s$  (Mueller and Schmidt, 1987).
- The number of small primitive solutions is  $\ll se^{\Phi} h^{2/n}$  when  $n > 4se^{2\Phi}$  (Saradha and Sharma, 2017).

Note:  $\Phi$  measures the “sparsity” of  $F$  and satisfies  $\log^3 s \leq e^{\Phi} \ll s$ .

## Theorem (Mahler, 1964)

*For all polynomials  $f(x) \in \mathbb{C}[x]$  of degree  $n \geq 2$ ,*

$$\text{sep}(f) > \frac{\sqrt{3}|\Delta_f|^{1/2}}{n^{(n+2)/2}M(f)^{n-1}}.$$

As expected, the quadratic case is straightforward:

**Proposition (K., 2023)**

*Let  $f(x) \in \mathbb{R}[x]$  have degree 2 and leading coefficient  $a$ . If  $f(x)$  has no real roots, then*

$$\text{sep}(f) \leq 2 \left( \frac{M(f)}{|a|} \right)^{1/2}.$$

*If  $f(x)$  has two real roots, then*

$$\text{sep}(f) \leq \left( \frac{M(f)}{|a|} \right) + 1.$$

*Moreover, these bounds are sharp.*

The totally real case is also manageable due to the restricted geometry of the root locations:

## Proposition (K., 2023)

*Let  $f(x) \in \mathbb{R}[x]$  be separable and monic of degree  $n \geq 3$  and suppose that all  $n$  of the roots of  $f$  are real. Then*

$$\text{sep}(f) \leq \frac{8.2}{n^{\frac{n}{n-1}}} \cdot M(f)^{1/(n-1)}.$$

## Proposition (K., 2023)

*Let  $f(x) \in \mathbb{R}[x]$  have degree 3 and leading coefficient  $a$ . If  $f(x)$  has exactly one real root, then*

$$\text{sep}(f) < \sqrt{3} \left( \frac{M(f)}{|a|} \right)^{1/2}.$$

## Proposition (K., 2023)

*Suppose that  $f(x) \in \mathbb{R}[x]$  has degree 4, leading coefficient  $a$  and no real roots. Then*

$$\text{sep}(f) \leq \sqrt{2} \left( \frac{M(f)}{|a|} \right)^{1/4}.$$

*Moreover, this bound is sharp.*

## Conjecture (K., 2023)

*Suppose  $f(x) \in \mathbb{R}[x]$  is monic of degree  $n$ . If  $f(x)$  has any real roots, then  $\text{sep}(f) \ll_n M(f)^{1/(n-1)}$ . If  $f(x)$  has only nonreal roots, then  $\text{sep}(f) \ll_n M(f)^{1/n}$ .*

## Theorem (K., 2023)

*This conjecture holds for  $f(x) \in \mathbb{R}[x]$  which meet any of the following conditions:*

- 1**  $\deg(f) = 2$ .
- 2**  $\deg(f) = 3$ .
- 3**  $\deg(f) = 4$  and  $f(x)$  has no real roots.
- 4** Every root of  $f(x)$  is real.
