The University of Calgary, located in the heart of Southern Alberta, both acknowledges and pays tribute to the traditional territories of the peoples of Treaty 7, which include the Blackfoot Confederacy (comprised of the Siksika, the Piikani, and the Kainai First Nations), the Tsuut'ina First Nation, and the Stoney Nakoda (including Chiniki, Bearspaw, and Goodstoney First Nations). The City of Calgary is also home to the Métis Nation of Alberta Region 3.

Let $F(x, y)$ be an integral binary form which is irreducible over \mathbb{Z} and has degree at least 3. Let h be an integer. Then the equation

$$F(x, y) = h$$

is known as a *Thue equation* and the inequality

$$|F(x, y)| \leq h$$

is known as a *Thue inequality*.

Theorem (Thue, 1909)

There are finitely many integer solutions to any Thue equation.

Corollary (Thue, 1909)

There are finitely many integer solutions to any Thue inequality.

Why all the hypotheses?

Theorem (Thue, 1909)

$|F(x, y)| \leq h$ has finitely many integer solutions when $F(x, y) \in \mathbb{Z}[x, y]$ has $\deg(F) \geq 3$, is irreducible, and is homogeneous.

Why all the hypotheses?

Theorem (Thue, 1909)

$|F(x, y)| \leq h$ has finitely many integer solutions when $F(x, y) \in \mathbb{Z}[x, y]$ has $\deg(F) \geq 3$, is irreducible, and is homogeneous.

Necessity of Hypotheses

- $\deg(F) \geq 3$ is necessary: $F(x, y) = x^2 - 2y^2$ is irreducible and homogeneous, and $|F(x, y)| \leq 1$ has infinitely many integer-pair solutions.

Every solution (p, q) to the Thue inequality $|F(x, y)| \leq h$ with $q \neq 0$ yields a good rational approximation $\frac{p}{q}$ to a root α of $f(X) = F(X, 1)$.

Question

Why do we care about rational approximations of algebraic numbers?

Answer

There are many tools (some of which are effective!) to find/count good rational approximations of algebraic numbers.

Theorem (Mahler, 1934)

Let

$$V(F, 1) := \text{vol}\{(x, y) \in \mathbb{R}^2 : |F(x, y)| \leq 1\}.$$

Then

$$N(F, h) \asymp h^{2/n} V(F, 1)$$

i.e. there are constants C_1 and C_2 so that

$$C_1 h^{2/n} V(F, 1) \leq N(F, h) \leq C_2 h^{2/n} V(F, 1).$$

Moral

The factor of $h^{2/n}$ is necessary and sufficient and we expect

$$N(F, h) \approx h^{2/n} \cdot N(F, 1).$$

- Manipulate inequalities to find that the denominators of the rational approximations must be exponentially far apart.

Counting Medium Solutions

Our improvement involves efficiently bounding t in the situation where both

$$Y_S \leq q_0 < q_1 < \cdots < q_t \leq Y_L$$

and the inductive relation

$$q_{i+1} > \frac{q_i^{\frac{n}{s}-1}}{K}$$

hold.

and the inductive relation

$$q_{i+1} > \frac{q_i^{\frac{n}{s}-1}}{K}$$

hold.

Lemma (K., 2021)

If $n \geq 3s$ and there are $t + 1$ primitive medium solutions associated to α , then

$$t \leq \frac{\log \left[\frac{\log Y_L K^{-1/(\frac{n}{s}-2)}}{\log Y_S K^{-1/(\frac{n}{s}-2)}} \right]}{\log \left(\frac{n}{s} - 1 \right)}.$$

Moreover, this bound is as sharp as possible, given existing approximation results.

Theorem (K., 2021)

The number of primitive medium solutions to $|F(x, y)| \leq h$ when $n \geq 3s$ is

$$\ll s \left(1 + \log \left(s + \frac{\log h}{\max(1, \log H)} \right) \right)$$

Bounds for Small and Large Solutions

- The number of large primitive solutions is $\ll s$ (Mueller and Schmidt, 1987).
- The number of small primitive solutions is $\ll se^{\Phi} h^{2/n}$ when $n > 4se^{2\Phi}$ (Saradha and Sharma, 2017).

Note: Φ measures the “sparsity” of F and satisfies $\log^3 s \leq e^{\Phi} \ll s$.

Asymptotic Bounds

As a consequence:

Theorem (K., 2023)

When $n > 4se^{2\Phi}$, the number of primitive solutions to $|F(x, y)| \leq h$ is

$$\ll se^{\Phi} h^{2/n}.$$

Recall that $\log^3 s \leq e^{\Phi} \ll s$.

$n = 17$	8	6	8	8	-	-	-	-	-	-	...	-

Maximum number of solutions to $|F(x, y)| = 1$ for any trinomial of height H and degree n

Thank you!
